-16-

CLAIMS:

- 1. A method for predicting the onset of a medical condition in a human patient, comprising:
- measuring a concentration level of at least one breath gases exhaled by
- 5 the patient; and

15

- comparing said measured concentration level with a predetermined concentration level indicative of an onset of said medical condition.
- 2. The method of Claim 1 for predicting the onset of a medical condition wherein said medical condition is pain.
- 10 3. The method of Claim 1 for predicting the onset of a medical condition wherein said medical condition is the occurrence of a stroke.
 - 4. The method of Claim 1 for predicting the onset of a medical condition further including the step of generating an index responsive to said measured concentration level, said index representative of a likelihood of onset for said medical condition.
 - 5. The method of Claim 1 for predicting the onset of a medical condition wherein said measuring step includes measuring a concentration of carbon monoxide breath gas exhaled by the patient.
- 6. A method for predicting the onset of one or more sickle-cell anemia related pathologies in a human patient having sickle-cell anemia, comprising:

measuring concentration levels of one or more breath gases exhaled by the patient; and

comparing said measured concentration levels with predetermined concentration levels indicative of an onset of one or more selected sickle-cell pathology.

5

15

- 7. The method of Claim 6 wherein said sickle-cell anemia pathologies include one or more pathologies from a set of pathologies including pain, anemia, stroke, or infection.
- 8. The method of Claim 6 wherein each of said one or more selected sickle-cell anemia related pathologies are each influenced by a decreased nitrous-oxide (NO) bioavailability.
 - 9. A method for predicting the onset of at least one (NO)-related negative influence in a human patient, comprising:

measuring concentration levels of one or more breath gases exhaled by the patient; and

- comparing said measured concentration levels with predetermined concentration levels indicative of an onset of at least one selected (NO)-related negative influence.
- 10. The method of Claim 9 wherein said (NO)-related negative influence include (NO)-related negative influences of hemolysis in a human patient and (NO)-related negative influences of chronic hereditary hemolytic disease in a human patient.

11. The method of Claim 10 wherein said one or more (NO)-related negative influences of chronic hereditary hemolytic disease include one or more pathologies from a set of pathologies including pulmonary hypertension, cutaneous ulceration, renal failure, thrombotic thrombocytopenic purpura, and malaria.

5

15

- 12. The method of Claim 9 for predicting the onset of one or more (NO)-related negative influences in a human patient wherein said one or more (NO)-related negative influences are created or worsened by an ivHb-dependent decrease in (NO) bioavailability.
- 10 13. An apparatus for predicting the onset of a medical condition in a human patient, comprising:

means for measuring a concentration levels of at least one breath gas exhaled by the patient; and

means for comparing said measured concentration level with at least one predetermined concentration level indicative of an onset of said medical condition.

- 14. The apparatus of Claim 13 wherein said means for comparing includes a logic circuit.
- 15. The apparatus of Claim 13 further including a display operatively coupled to said means for comparing;

-19-

wherein said means for comparing is further configured to generate an index responsive to said measured concentration level, said index representative of a likelihood of onset for said medical condition; and wherein said means for comparing is further configured to control said display to display said index.

- 16. The apparatus of Claim 13 for wherein said medical condition is pain.
- 17. The apparatus of Claim 13 for wherein said medical condition is the occurrence of a stroke.
- 18. The apparatus of Claim 13 wherein said means for measuring is configured to measure a concentration of carbon monoxide breath gas exhaled by the patient.
